Assessment Unit A2 1 assessing

Physiology, Coordination and Control, and Ecosystems

[ABY11]

ABY11

TUESDAY 4 JUNE, MORNING

TIME

2 hours 15 minutes.

INSTRUCTIONS TO CANDIDATES

Write your Centre Number and Candidate Number in the spaces provided at the top of this page.

You must answer the questions in the spaces provided.

Do not write outside the boxed area on each page or on blank pages.

Complete in black ink only. Do not write with a gel pen.

Answer all nine questions.

INFORMATION FOR CANDIDATES

The total mark for this paper is 100.

Section A carries 82 marks. Section B carries 18 marks.

Figures in brackets printed down the right-hand side of pages indicate the marks awarded to each question or part question.

You are reminded of the need for good English and clear presentation in your answers.

Use accurate scientific terminology in all answers.

You should spend approximately 25 minutes on Section B.

You are expected to answer Section B in continuous prose.

Quality of written communication will be assessed in Section B.

1 (a) The graph below shows the changes in blood antibody level in an individual over time. This individual was infected by the same type of bacterium on two separate occasions.

(i) Apart from a higher blood antibody level, describe **one** other way in which the secondary response differs from the primary response.

		[1]
		111

(ii) Complete the passage below describing antibody production.

There is a delay following initial infection as _____

cells need to be activated. Activation of these cells results in the production

of _____ cells which produce antibodies. [2]

(b)	The formation of antigen-antibody complexes can cause bacterial cells to form clumps (agglutination).
	Describe how phagocytosis leads to the destruction of these clumps of bacteria

Totali

(c) Succession is a change in species composition in a habitat over time. In cow dung (faeces), the fungal species found change as the dung ages. This is an example of succession.

While the faeces are still in the cow's body, spores from a range of fungal species are present. Once the dung is released, relatively simple fungi are active initially in decomposing the dung. At this stage, the dung is dense and compact, and contains a wide range of organic compounds.

Over subsequent weeks, the dung becomes more fragmented and less dense, and organic content is reduced. At this stage, more complex fungi are active in decomposition as shown in the photograph below.

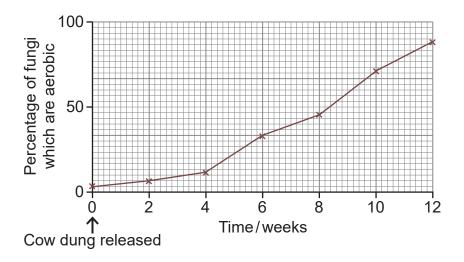

Source: Chief Examiner

(b) Ermine moths feeding on hawthorn are an example of a +/- interaction. Cattle grazing in fields is another example of a +/- interaction.

The Common Nettle (*Urtica dioica*) is a plant which often occurs in hedgerows or field edges grazed by cattle. Nettles have small needle-shaped hairs called trichomes which can release chemicals that irritate skin.

The relative number of trichomes on nettle plants was investigated in several fields. Some fields had been grazed by cattle for several years, while others had only occasional or no grazing.

Level of grazing	Relative number of trichomes
none	low
continuous over many years	high
occasional	moderate
previously heavily grazed, but none for two years	moderate
none until three years ago – now heavily grazed	high

(i)	Summarise the trend shown by these results.	
		[1]
(ii)	Suggest and explain the advantage to nettle plants of the trend identified.	
		[2]

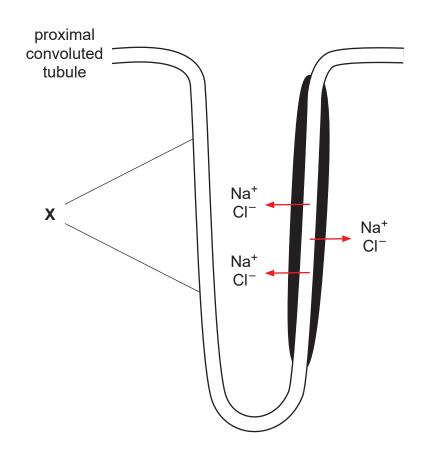

8 Osmoregulation involves maintaining the solute potential of the blood close to its set point (normal value). Osmoregulation is possible because the process of reabsorption of water from the urinary filtrate into the blood can be controlled.

(a) Name the hormone responsible for controlling reabsorption of water in the kidney.

______[1]

(b) The diagram below represents the part of a nephron containing the loop of Henle.

(i) Name the part of the loop of Henle labelled X.

______[1]

(ii) Using the letter **Y**, label the part of the loop of Henle where the filtrate would be expected to be most concentrated. [1]
